PHP ++

or, how to level up without the grind

$$I(\lambda, T) = \frac{2hc^3}{\lambda^5} \frac{1}{e^{\frac{hc}{\lambda kT}} - 1}$$

PHP 6 = PHP 5 + Unicode

PHP 5 = PHP 6 - Unicode

Unicode = PHP 6 - PHP 5

What is PHP?

Ha. Ha.

What is Unicode?

and why do I need?

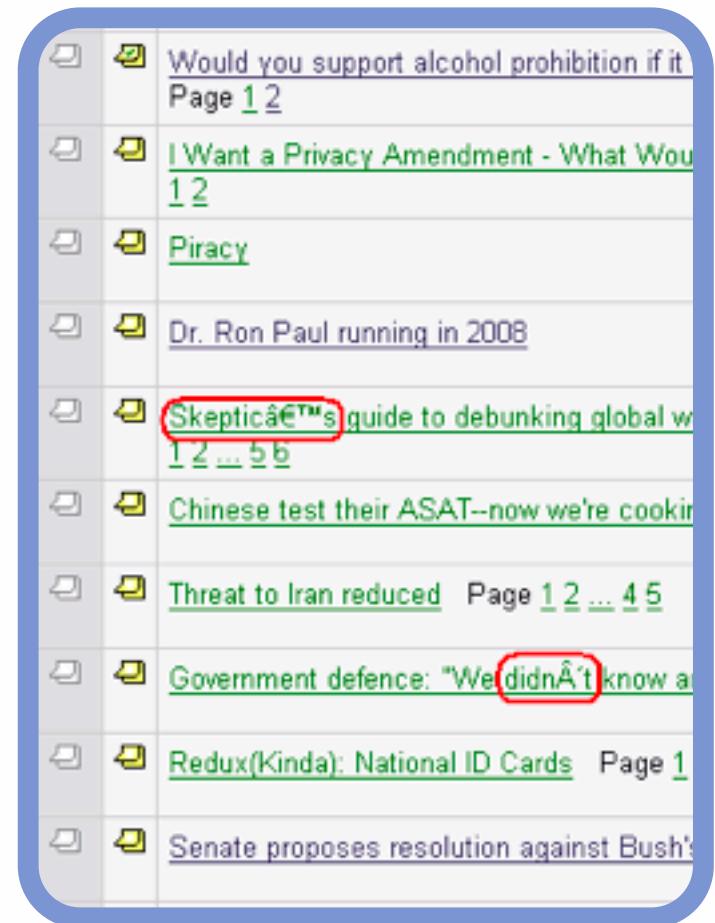

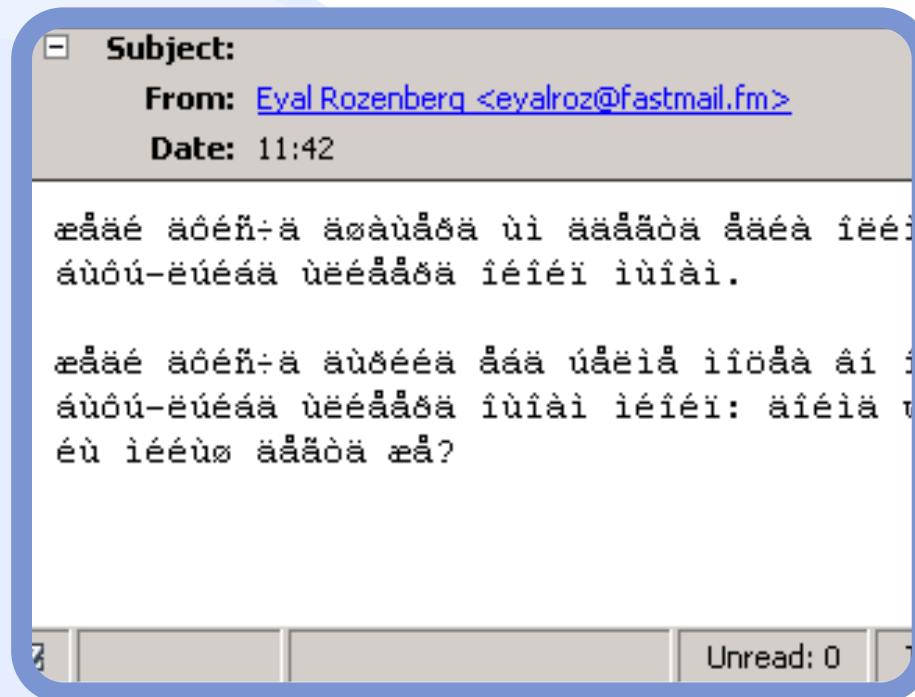

mojibake

もじばけ

mojibake

phenomenon of incorrect, unreadable characters shown when computer software fails to render a text correctly according to its associated character encoding

Encoding soup

1. provinciality
2. computer limitations
3. inertia

Unicode

provides a unique number
for every character:

no matter what the platform,

no matter what the program,

no matter what the language.

unicode standard

- Developed by the Unicode Consortium
- Covers all major living scripts
- Version 5.0 has 99,000+ characters
- Capacity for 1 million+ characters
- Widely supported

- Hosted by Unicode Consortium
- Goals:
 - Common, necessary software locale data for all world languages
 - Collect and maintain locale data
 - XML format for effective interchange
 - Freely available
- Latest release: July 2007 (CLDR 1.5)
- 394 locales, with 135 languages and 149 territories

PHP 6

unicode support

- Everywhere:
 - in the engine
 - in the extensions
 - in the API

unicode support

- Native and complete
 - no hacks
 - no mishmash of external libraries
 - no missing locales
 - no language bias

string types

Unicode

- text

- default for literals, etc

Binary

- bytes

- everything \notin Unicode type

string types

- internal processing: Unicode
- interface to outside world: binary

● All string literals are Unicode

```
$str = "Hello, world!"; // Unicode string
echo strlen($str);      // result is 13
```

```
$jp = "検索オプション"; // Unicode string
echo strlen($jp);       // result is 7
```

● String offsets work on code points

```
$str = "大学";    // 2 code points
echo $str[1];    // result is 学
$str[0] = 'サ'; // full string is now サ学
```

identifiers

● Unicode identifiers are allowed

```
class コンポーネント {  
    function ફુંક્શન્સ { ... }  
    function சிவாஜி கணேசன் { ... }  
    function ପ୍ରାଣ୍ୟମା { ... }  
}  
  
$provider = array();  
$provider['רַעֲיוֹלָה שְׁנָה'] = new コンポーネント();
```

functions

● Functions understand Unicode text

- `strtoupper()` and friends do proper case mapping

```
$str = strtoupper("fußball"); // result is FUSSBALL
```

```
$str = strtolower("ΣΕΛΛΑΣ"); // result is σελλάς
```

- `strip_tags()` works on complex text

```
$str = strip_tags("雅<span>είναι</span>通");
```

- `strrev()` preserves combining sequences

```
$u = "Viء\u0302\u0323t Nam"; // Việt Nam
$str = strrev($u);           // result is maN t̄eiV,
                            // not maN ūeiV
```

streams

- Built-in support for converting between Unicode strings and other encodings on the fly
- Reading from a UTF-8 text file:

```
$fp = fopen('somefile.txt', 'rt');  
$str = fread($fp, 100); // returns 100 Unicode characters
```

- Writing to a UTF-8 text file:

```
$fp = fopen('somefile.txt', 'wt');  
fwrite($fp, $uni); // writes out data in UTF-8 encoding
```

- Grab first 5 titles from Reuters China feed, clean up, and send out as JSON

```
$xml = simplexml_load_file(  
    'http://feeds.feedburner.com/reuters/CNTbusinessNews/');  
  
$titles = array();  
$i = 0;  
foreach ($xml->channel->item as $item) {  
    // each title looks like this: (台灣匯市) 台幣兌美元  
    $title = preg_replace('!\p{Ps}.*\p{Pe}\s*!', '', $item->title);  
    $titles[] = $title;  
    if (++$i == 5) break;  
}  
  
echo json_encode($titles);
```

pecl/intl

features

- Locales
- Collation
- Number and Currency Formatters
- Date and Time Formatters
- Time Zones
- Calendars
- Message Formatter
- Choice Formatter
- Resource Handler
- Normalization

versioning

- Works under PHP 5 and 6
- Uses native strings in PHP 6
- Requires UTF-8 strings in PHP 5
- Can use mbstring, iconv

Collator

comparing strings

- **compare(\$str1, \$str2) = -1, 0, 1**

```
$coll = new Collator("fr_FR");
if ($coll->compare("côte", "coté") < 0) {
    echo "less\n"; ←
} else {
    echo "greater\n";
}
```

côte < coté

sorting strings

- **sort(\$array, \$flags)**
- **asort(\$array, \$flags)**
- **sortWithSortKeys(\$array)**

```
$strings = array(  
    "cote", "côte", "Côte", "coté",  
    "Coté", "côté", "Côté", "coter");  
$coll = new Collator("fr_FR");  
$coll->sort($strings);
```

```
cote  
côte  
Côte  
coté  
Coté  
côté  
Côté  
coter
```

strength control

- **setStrength(\$strength)**
- **getStrength()**

```
$coll = new Collator("fr_CA");
$coll->setStrength(Collator::PRIMARY);
if ($coll->compare("côte", "coté") == 0) {
    echo "same\n"; ←
} else {
    echo "different\n";
}
```

côte = coté

numeric collation

● Collator::NUMERIC_COLLATION

```
$strings = array("10", "1", "2");
$coll->setAttribute(Collator::NUMERIC_COLLATION,
                     Collator::ON);
$coll = new Collator(null);
$coll->sort($strings);
```

1 < 2 < 10

NumberFormatter

what it is

- allows to format numbers as strings according to the localized format or given pattern or set of rules
- and parse strings into numbers according to the above patterns
- replacement for `number_format()`

formatter styles

123456.789 in en_US

- NumberFormatter::PATTERN_DECIMAL
123456.79 (with ##.##)
- NumberFormatter::DECIMAL
123456.789
- NumberFormatter::CURRENCY
\$123,456.79
- NumberFormatter::PERCENT
12,345,679%

formatter styles

123456.789 in en_US

- NumberFormatter::SCIENTIFIC

1.23456789E5

- NumberFormatter::SPELLOUT

one hundred and twenty-three thousand, four hundred and
fifty-six point seven eight nine

- NumberFormatter::ORDINAL

123,457th

- NumberFormatter::DURATION

34:17:37

MessageFormatter

what it is

- produces concatenated messages in a language-neutral way
- operates on *patterns*, which contain *subformats*

formatting

● **format(\$args)**

```
$pattern = "On {0,date} you have {1,number} meetings.";  
$args = array(time(), 2);  
$fmt = new MessageFormatter('en_US', $pattern);  
echo $fmt->format($args);  
  
// On November 22, 2007 you have 2 meetings.
```

formatting

Can use various style modifiers

```
$pattern = "On {0,date,full} you received  
           {1,number,#,##0.00} emails.";  
$args = array(time(), 184);  
$fmt = new MessageFormatter('en_US', $pattern);  
echo $fmt->format($args);  
  
// On Tuesday, November 22, 2007 you received 184.00  
emails.
```

formatting

Trying different locales

```
$fr_pattern = "Aujourd'hui, {0,date,dd MMMM},  
                il y a {1,number} personnes sur {3}.";  
$fr_args = array(time(), 6579844000.0, 3, "la Terre");  
  
$msg = new MessageFormatter('fr_FR', $fr_pattern);  
echo $msg->format($fr_args);  
  
// Aujourd'hui, 22 novembre, il y a 6 579 844 personnes  
sur la Terre.
```

other things

- APC bundled
- “taint” mode
- closures, aka “mind benders”
- a couple of syntactic sugar treats
- PCRE default regex engine
- 64-bit integer type
- general cleanup

Im in ur endginn

playin wif ur stringz

kthxbye
